

KWC – Environmental commitment

The need to protect mankind and the environment influences the way we think and act. KWC products enhance people's appreciation of the precious commodity of water and increase the joy it provides. Our products embody the traditional values of Swiss design, both in their functionality and in their aesthetics. Our products and production processes are designed to meet and exceed our obligations to the environment and to society.

Products and features are designed with the environment in mind.

KWC products and services are environmentally sustainable, supporting the efforts of the user to take steps toward ecological responsibility. We take the entire lifecycle of the product into consideration, from development to disposal. This means that we consider our resources and reduce the strain on the environment.

Water Conscious:

Most single lever faucets feature a cartridge with the option to reduce water flow from 2.2 gpm to 1.3 gpm for a voluntary 40% reduction on water use.

2-step ECO cartridge:

Our optional 2-step ECO cartridge allows a 16% savings on water use when operated in the first step at 1.8 gpm.

Temperature Limitation:

Most single lever faucets feature a cartridge with the option to limit the flow of hot water saving energy while guarding the user from scalds.

Low Lead High Quality Brass:

Our faucets utilize high quality brass with lead content less than 2% - substantially lower than the US maximum of 8% and conform to the regulations of NSF/ANSI Standard 61.

Flexible Water Connections:

Most faucets are assembled with flexible connection hoses to save our valuable resource of copper.

Thermostatic Technology:

With the flow smart feature limiting cold water until desired warm temperature is achieved, our thermostatic valve provides an approximate 30% water reduction over pressure balance valves in the ramp up mode.
